

PAQUA

Providing safe, sustainable
drinking water, globally.

Health

It is vitally important to provide clean water both for drinking and sanitation purposes within the healthcare sector. By providing an in-house water filtration system it guarantees clean water not only for drinking but for hand washing and instrument cleaning. An additional benefit is that our water filtration solution produces onboard disinfection that can be used round the hospitals on hard surfaces.

The PaquaVida Water Purification System provides safe, clean drinking water from almost

any fresh water source, with ground-breaking technology that offers great advantages over standard water purification systems.

If you have a fresh water source that requires treatment to meet strict drinking water standards, then PaquaVida can be your water filtration solution. Our Water Purification System will ensure that quality needs are met consistently, with low energy specifications and the smallest carbon-footprint within the water purification systems market.

Whether your requirement is for a temporary or permanent water purification solution, our PaquaVida Water Purification System will meet your needs and those of the population they serve, sustainably and reliably.

Natural protection and safe disinfection for a better environment.

PaquaLyte is a proven and tested natural multipurpose disinfectant solution. Made from the most natural materials – salt, water and electricity – PaquaLyte is a safe and extremely efficient solution effective in killing 99.999% of viruses and bacteria. It is suitable for use across all industries and environments, without the need of diluting.

Safety: PaquaLyte is perfectly safe to the planet and users, biodegradable, vegan-friendly, cruelty-free, ph neutral. If you get it in your eyes, then simply rinse with water. It kills spores, pollen, and bacteria effectively.

PaquaLyte Quality: PaquaLyte is manufactured in the UK to ISO 9001 and ISO 14001. Quality standards and our generator equipment suppliers are part of the consortium which own the approved active substance dossiers covering HOCl and Electro-Chemically Activated Water Union Biocides Products Regulations (EU 528/2012). Portsmouth Aviation the manufacturer is registered on the Artile 95 list.

Highly Effective: Extensive testing proves that it kills 99.999% of all viruses, bacteria,

and fungi on contact, including Covid, MRSA, E Coli, Ebola, Legionella, Campylobacter, Salmonella, SARS and Influenza to name but a few.

Best Value: PaquaLyte is a cost effective, proven disinfectant that can be scaled on demand and used as a fogging agent and general disinfectant. Our products are among the finest available, suitably priced and provide excellent assured quality and value. The need for clean, biodegradable, and environmentally acceptable biocides/virucides in the current environmentally sensitive climate, make PaquaLyte the perfect answer to the many challenges that the Covid Virus has highlighted.

PaquaLyte natural dry fog technology

Thorough cleaning and hygiene in health environments is essential to prevent the forming and spread of microorganisms. However, existing fogging disinfection products are not always fully effective and can be expensive. Many require ventilation as their use can cause skin and/or respiratory issues, are corrosive or stain, and at worst, cause long-term damage and illness.

PaquaLyte is a natural highly efficient fast-acting dry fog technology that sanitises large internal spaces, common touch surfaces and tricky areas such as air vents and under furniture effectively. PaquaLyte works by

mimicking the body's immune system and is classed as a green biocide which means that rooms and large spaces can be used immediately after aeration. It can be used on all surfaces and clothing in all medical environments that need to be kept sterile or where infection can quickly and easily spread. It will not stain and no wiping is required. Containing only eco-friendly disinfectants, this triple action automatic airborne ultra-fast decontamination solution does not cause any damage to sensitive medical equipment, computers, electronic devices or furniture.

Compared to traditional fogging technologies, PaquaLyte is inexpensive to buy, and all bottles and containers are refillable. It also operates autonomously, without the need for any personnel.

With full green credentials, this innovative solution is manufactured to ISO9001 standard and supports the 'GO green 2025' strategy.

FAQs

Q: Does the PaquaVida Water Purification System guarantee safe drinking water within all healthcare settings?

A: Yes. PaquaVida provides clean safe water for both drinking and sanitation purposes for hospitals, nursing homes, care homes and other clinical environments. It is a single source solution that complies with safety and quality standards and is rated for medical use.

Q: How do PaquaVida Water Purification Systems combat the critical need for water aid around the world?

A: Poor quality water has the potential to cause gastro-intestinal diseases which can quickly spread. Our systems do not use any hazardous chemicals and can draw from any fresh water source, such as lakes, rivers, streams and ponds, even those that are heavily contaminated, to give safe, fresh drinking water and sanitation where they are needed most.

Q: Can the system operate in areas without power supply?

A: PaquaVida has very low energy requirements and can be run from solar and/or wind turbine power, so will operate completely off-grid or in remote locations.

Q: Does it need maintenance?

A: Maintenance requirements are minimal as the system is completely autonomous. It just needs the occasional top-up of salt for onboard disinfection production. The system produces a biocide disinfection solution called PaquaLyte, which is automatically injected into the water flow in the unit that eliminates biofilm in the pipework and membranes that is the major cause of water filtration systems.

Q: How cost-effective is the system?

A: Running costs are a fraction of the cost of buying water in, so people can move away from transported tanked water, or move their current water treatment system to this more sustainable option.

Q: What is PaquaLyte made of?

A: PaquaLyte is simply made from a combination of water already cleaned by our system, high purity salt (sodium Chloride) and electricity to produce the active ingredient, Hypochlorous Acid (HCOL).

Mother nature has an internal process for producing HCOL naturally, in every mammal, via our white blood cells and it is a significant part of our immune system. It protects our bodies from the attack of harmful bacteria

and pathogens. Our PaquaLyte generators mimic the process found in nature.

Q: Are Paqua products environmentally friendly?

A: Yes, our sustainable PaquaVida system employs electrolysis and filtration for water purification, without the use of any hazardous chemicals. PaquaLyte is produced automatically as part of the PaquaVida water purification process, therefore reducing the need for additional transportation to the system. PaquaLyte will revert to water and small amount of salt if spilt. Additionally, our PaquaLyte bottles and containers are refillable to reduce waste.

Q: Does an operator need to be present on site or available to maintain the fogging system?

A: No, the fogging machine can be run safely whilst unattended. Just add the PaquaLyte disinfectant, press a button and leave it to run.

Q: How soon can I enter the space after it has been fogged?

A: You can enter the space within 30 minutes after the fogging has finished

allowing enough time to ensure the room is fully disinfected. The room can then be re-used.

Q: Does the fogging leave a residue or wet surface?

A: No, the tiny droplets of aerated PaquaLyte are dry when they land so no residue or wetness is left behind.

Effective

- Proven to EU Drinking Water Directive 98/83
- Highly effective against source water contaminants
- Very high drinking water yield

Great Value

- Low running cost
- Low power requirements
- Low maintenance and simple to operate
- Safe, easily sourced consumables
- Available to buy or lease

Practical

- Self-contained modular units
- Remote monitoring and adjustments
- Fits in ISO containers or existing infrastructure
- Easy to use and maintain in the country of use
- Continually monitors water quality
- Fully autonomous operation
- No harsh chemicals needed
- Self-cleaning
